## 2. Funded by the National MS Society

XIII Encuentro  
Cooperación  
Farma – Biotech

**National  
Multiple Sclerosis  
Society**

**Bionure and National MS Society enter into a collaboration to support the development of a new chemical entity for Optic Neuritis and MS**

- ▶ The National Multiple Sclerosis Society is aimed at accelerating the development of new and improved therapies for MS
- ▶ The National MS Society will provide funding to Bionure for the late-preclinical development of BN201 to enable IND filing to support the Phase 1 clinical study in Acute Optic Neuritis (AON). Optic neuritis is often a first sign of multiple sclerosis.

## Funded by the National MS Society (2015)

Best path  
to demonstrate  
neuroprotection

**Thanks to this strategy we avoid the main risk in trials\* and leverage a huge potential in CNS line extension (e.g. MS)**

*\*Costly trials (many patients required in long trials) that may fail late at Phase III (because of difficulties for measuring efficacy)*

## 2b. MOA of BN201: SGK agonist

FOXO-3 staining by immunofluorescence  
in SH-SY5Y after BN201 exposure (in vitro)

<sup>1</sup>Brunet A, Park J, Tran H. et al. Protein kinase SGK mediates survival signals by phosphorylating the forkhead transcription factor FKHL1 (FOXO3a); *Mol Cell Biol* 21(3):952-965 (2001)

## 2b. Neuroprotection + Remyelination activity

XIII Encuentro  
Cooperación  
Farma – Biotech

### BN201 is highly efficacious in animal models

**Lysolecithin-induced  
demyelination model  
(Optic Neuritis)  
(*Demyelination*)**

**Experimental Autoimmune  
Encephalomyelitis model  
(Multiple Sclerosis)  
(*Inflammation*)**

**Hypertensive Glaucoma  
(*Neurodegeneration*)**

## 2b. BN201 prevents demyelination in LPC model

### LFB staining for optic nerve demyelination

\*\*\*p < 0.001 compared to placebo

**i.p. BN201 protects myelin in the lysolecithin induced demyelinating model in rat**

## 2b. BN201 promotes neuroprotection in LPC model

### H&E for Retinal Ganglion Cell (RGC) count

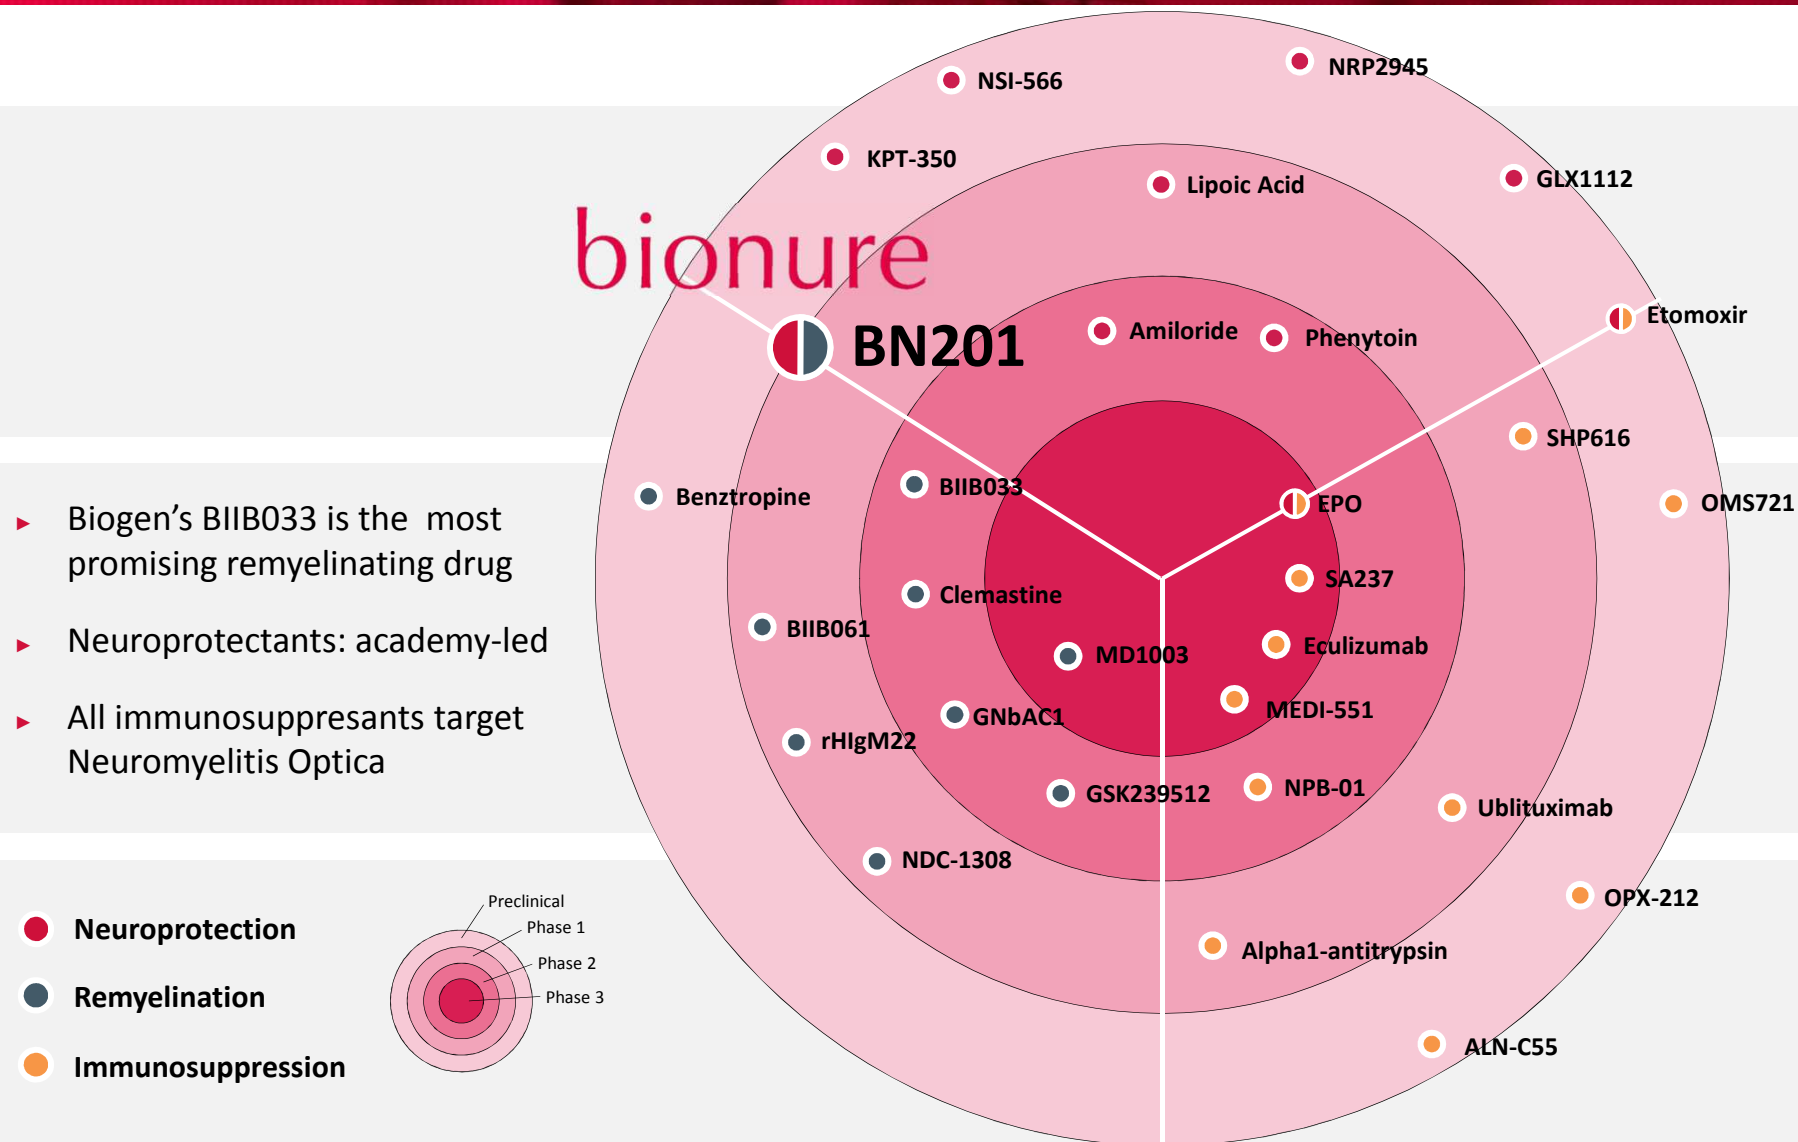

\*\*p < 0.01 ; \*\*\*p < 0.001 compared to placebo

**i.p. BN201 protects RGC neurons in the lysolecithin induced demyelinating model in rat**

## 2c. Market differentiation: AON/MS and NMO

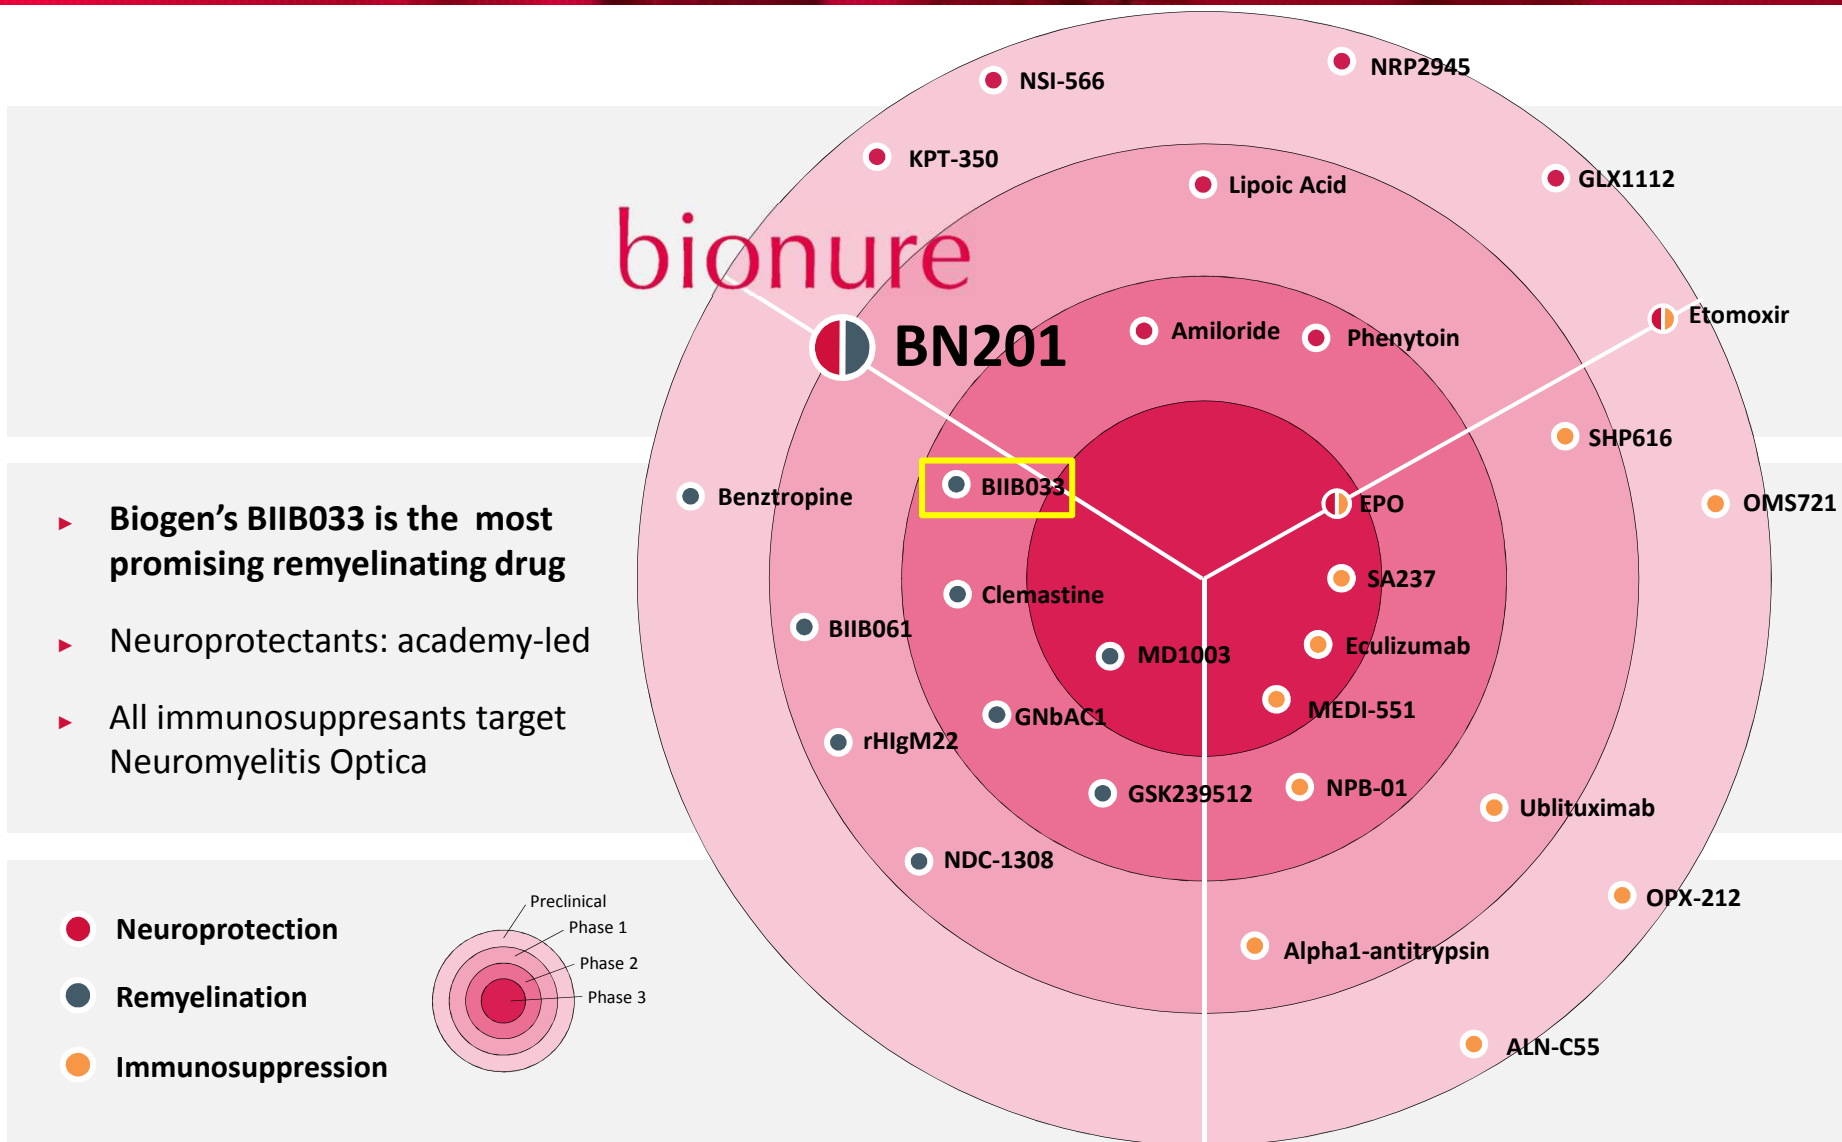

XIII Encuentro  
Cooperación  
Farma – Biotech

- ▶ Biogen's BIIB033 is the most promising remyelinating drug
- ▶ Neuroprotectants: academy-led
- ▶ All immunosuppressants target Neuromyelitis Optica

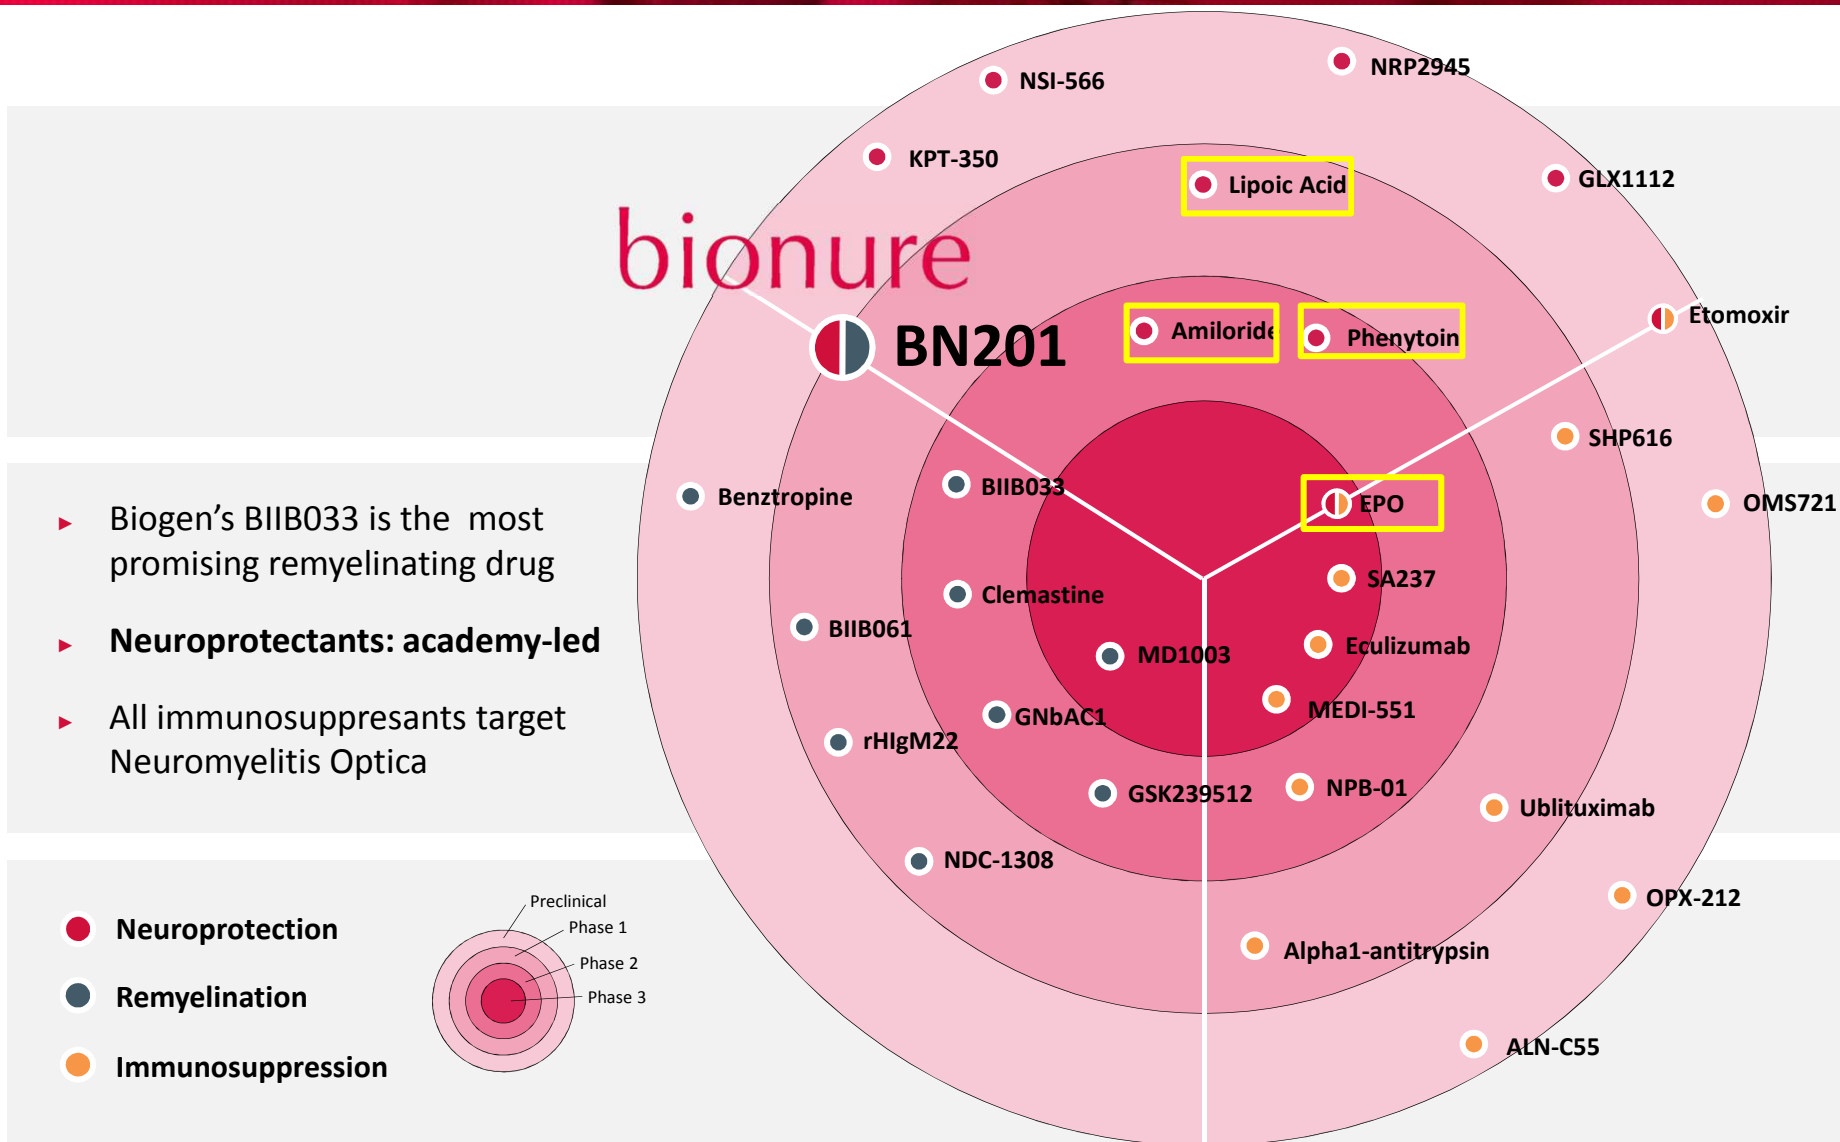

## 2c. Market differentiation: AON/MS and NMO

XIII Encuentro

Farma – Biotech

**Unique profile**  
**neuroprotection**  
**+ remyelination**

- ▶ Biogen's BIIB033 is the most promising remyelinating drug
- ▶ Neuroprotectants: academy-led
- ▶ All immunosuppressants target Neuromyelitis Optica

- Neuroprotection
- Remyelination
- Immunosuppression

bionure

**BN201**

# BN201: the most promising candidate in the pipeline

*“The interest in remyelinating compounds has recently dramatically increased as one of the hottest areas in drug discovery, together with immuno-oncology and gene therapy. But you can’t remyelinate when there are no axons left.”*

*Promoting neuroprotection plus remyelination may be the way”*

*Prof. Larry Steinman, Stanford*

## 2d. Status of development: milestones

XIII Encuentro  
Cooperación  
Farma – Biotech

### Development Milestones

 <b>Preclinical</b>	<b>MOA described</b> First-in-Class, SGK agonist	<b>Neuroprotection + Remyelination</b>	<b>GLP Toxicology</b> completed

IV, acute, recurrent intervention for **AON** and **NMO**

### 3. Second Generation Program

XIII Encuentro  
Cooperación  
Farma – Biotech

## Leveraging Huge Line Extension Potential

NEURODEGENERATION

**NEURODEGENERATIVE DISEASES**  
**ALZHEIMER PARKINSON**  
**MULTIPLE SCLEROSIS**  
**AMYOTROPHIC SCHIZOPHRENIA**  
**LATERAL SCLEROSIS DEMENTIA**  
**GLAUCOMA** **SPINAL MUSCULAR ATROPHY**  
**FRIEDREICH'S ATAXIA**

### 3. Second Generation Program Outline

XIII Encuentro  
Cooperación  
Farma – Biotech

**Goal: Develop new compounds (BN201-related) and new formulations for new indications**

- ▶ 2-3 years program; 2.5M\$ (including FTEs for chemistry)
- ▶ New compounds designed based on Structure-Activity Relationships (SAR).  
Milestones to achieve:

1. Determination of active pharmacophores of BN201 (SAR)
2. Identify candidates with enhanced potency and bioavailability
3. Validate new candidates identified in a disease model

**Flexible models for collaboration with pharma industry**

## 4. Pitfalls & Risks to be considered

### Technical/Clinical Risk

- ▶ Translation from animal models to human
- ▶ Clinical design/endpoints
- ▶ Clinical execution

### Regulatory risk

- ▶ Feedback from agencies

### Financial risk

- ▶ Fundraising
- ▶ Partnership with biotech/pharma cos.

## 4a. Technical/Clinical risk

## 2. Target Indications: orphan ophthalmology

XIII Encuentro  
Cooperación  
Farma – Biotech

### Acute Optic Neuritis

Acute inflammation  
of the optic nerve  
(incidence >5/100,000)  
>120,000 new patients/year in US and Europe

Significant visual impairment  
Eye pain and vision loss

Short recurrent IV treatment  
Market potential >\$900M

IV corticosteroids  
for acute events

### Neuromyelitis Optica

Chronic inflammation and demyelination  
of the optic nerve and spinal cord  
(prevalence 1-5/100,000)  
>20,000 patients in US and Europe

Blindness, paralysis and death

Short recurrent IV treatment  
Market potential >\$300M

IV corticosteroids for acute events  
Immunosuppression to prevent relapse

**Lack of therapies and strong unmet need**

## 2b. Role of SGK in neuroprotection

bionure

SGK is an **intracellular serine/threonine** kinase

Activated in response to **stress** (glucose, pH, ions, oxidative stress) and **trophic factors**

Promotes **cell protection**, mediated by Foxo3 and Nedd4.2

- ▶ SGK mediates the signaling of trophic factors (e.g. IGF or BDNF) and modulates ion channels. Both mechanisms are related with neuronal protection and survival, as well as protecting against neuroexcitability, neuronal apoptosis, neurodegeneration and promoting axonal regrowth<sup>2,3</sup>

<sup>2</sup>Lang F et al. (Patho)physiological significance of the serum- and glucocorticoid-inducible kinase isoforms. *Physiol Rev* 2006;86:1151-1178

## 2b. Lysolecithin induced demyelination (LPC) model

- ▶ Demyelination induced by injection of Lysolecithin in the optic nerve of rats. Curative treatment with i.p. BN201 started 1 hour after injection.

- ▶ Model of demyelination for Optic Neuritis with no inflammatory component. Target: myelin (mainly), axons and neurons (RGCs)

### Readouts

- ▶ Hematoxylin-eosin (H&E) for RGC count
- ▶ Luxol Fast-Blue (LFB) for demyelination
- ▶ Bielchowsky silver impregnation (BSI) for axonal loss

## 2.4 Phase 1 trial in healthy volunteers

### A Randomized, Double-Blind, Placebo-Controlled, Single and Multiple Ascending Dose Study of the Safety, Tolerability, PK and PD of BN201 in Adult Healthy Volunteers

- ▶ SAD and MAD with 2 single- and 2 multiple dose cohorts (32 volunteers, 24 on drug). Alternating escalating (Leap Frog) design for SAD including 4 doses
- ▶ Duration of treatment: 5 days for MAD; one single 1h infusion for SAD
- ▶ Primary Endpoint(s):
  - ▶ Safety and tolerability of BN201 I.V. injection following a single and multiple dose in healthy subjects.\*
  - ▶ PKPD of different doses of BN201 I.V. injection compared to placebo.\*\*
- ▶ Location: PRA Health Sciences, the Netherlands

**CTA approved on August 2015 by Netherlands Agency**

*\*The safety of BN201 I.V. Injection will be assessed by adverse event reports, neurological examination, cognitive examination using the Mini-Mental test (MMT), neuropathic pain assessment, cardiovascular assessment: 1) telemetry, 2) electrocardiogram (ECG); 3) Holter (24h), electroencephalographic (EEG) assessment, laboratory measurements (chemistry, hematology, urinalysis), and vital signs.*

*\*\*Ratio of Foxo3 translocation from nucleus to cytoplasm in peripheral blood mononuclear cells by immunofluorescence*

## 2.4 Phase 2a in Acute Optic Neuritis (MS)

**A Randomized, Double-Blind, Parallel-Group, Placebo Controlled PoC Study to Assess the Efficacy, Safety, Tolerability, and Pharmacokinetics of BN201 in Subjects with First Episode of Acute Optic Neuritis (AON).**

- ▶ Population selected: 75 patients (2 doses of BN201 and placebo, 50 will be on drug) with confirmed diagnosis of first episode of unilateral AON with an onset within 2 weeks prior to study dosing 1/baseline.
- ▶ Type of treatment: Two different doses of BN201 (IV route / QD / 5 days), add-on therapy to corticosteroids (placebo refers to second infusion)
- ▶ **Primary endpoint: Change in thickness of the Ganglion Cell Layer/Inner Plexiform Layer at Week 12** for the affected eye as determined by OCT. *Note: 12 weeks because most of the disability is established during this period of time.*

**FDA: GCL thickness (measure by OCT) is an adequate endpoint for a Ph2a and the primary endpoint can be evaluated at 12 weeks for registry, with additional visits at months 6 and 12 for labeling purposes**

**Gabilondo et al. Dynamics of retinal injury after acute optic neuritis. *Ann Neurol*. 2015:** Atrophy of the GCL in the first month is a strong predictor of long-term visual disability. A decrease of 4  $\mu\text{m}$  in GCL/ is highly predictive of LCVA.

**Access to patients: extensive network of experts and collaborators, key in orphan diseases**

## 2.3 Second-generation Program

- ▶ 2-3 years program; 2.5M\$ (including FTEs for chemistry)
- ▶ New compounds designed based on SAR study
- ▶ 4 rounds of 20 new potential hits synthesized
- ▶ Evaluation of potency and bioavailability in parallel and final validation in disease model
- ▶ First compounds validated expected after 18 months (1<sup>st</sup> round)
